System Requirements & Installation Guide

To run this asteroid photometry pipeline smoothly, make sure your computer meets the following software and hardware requirements:

1. **GPU (Graphics Card):** Required for the rendering engine (even a basic, low-end, or integrated GPU will work, as long as it supports Blender Eevee).
2. **Python:** Required for executing the scripts and calculations.
3. **Blender:** Required for the 3D rendering engine. (*Note: Ensure Blender is installed in its default path or specify it in your configuration.*)
4. **Visual Studio Code (VS Code):** Optional, but strongly recommended as a visual code editor/launcher.

Quick Setup Steps

1. **Install Python Packages:** Simply double-click (or run) the file named python_instrument_requirements.py in the project folder. This will automatically install all the necessary libraries for you.
2. **Run the Pipeline:** Once Python, Blender, and the required packages are installed, you are ready to configure your simulation.
